Insights Summary — Sales Performance Dashboard

1. Overview

This document breaks down the key findings from the Sales Performance Dashboard built in Power BI. The dashboard analyzes lead-to-conversion performance across marketing channels, counsellors, and time periods, with the goal of identifying clear, actionable opportunities to improve sales outcomes.

---

2. Headline Metrics

Metric	Value
Total Leads	29
Total Conversions	15
Conversion Rate	51.72%
Total Revenue	₹750,000
Average Revenue per Conversion	₹50,000

At a high level, roughly **1 in 2 leads convert**, and each conversion is worth an average of ₹50K — giving a clear baseline to measure future performance against.

---

3. Insight #1: Ads Outperforms YT as a Lead Source

The Lead Source breakdown compares two channels — **Ads** and **YT (YouTube)** — across both total leads generated and conversions achieved.

Finding: Ads consistently brings in a higher volume of leads *and* a higher count of conversions than YT.

Business implication: If marketing budget is limited, this data supports allocating a larger share of spend toward Ads over YT, since it is currently the higher-performing channel on both volume and conversion metrics.

Suggested next step: Track this over a longer time window to confirm the trend holds, and consider testing increased Ads budget while monitoring cost-per-conversion (not just conversion count) to ensure profitability scales with volume.

---

4. Insight #2: "Connected" Calls Are the Biggest Lever for Conversion Improvement

The Breakdown by Call Status shows four categories: **Connected (44.83%), Disqualified (24.14%), NATC — Not Answering The Call (20.69%), and Positive (10.34%)**.

Finding: "Connected" is the single largest segment, meaning nearly half of all leads reach a live conversation. This is the biggest pool of leads where conversion quality — not lead volume — determines outcome.

Business implication: Since almost half the funnel is already reaching a connected call, the fastest way to lift the overall conversion rate isn't necessarily generating more leads — it's improving how connected calls are handled (e.g., call scripts, objection handling, follow-up timing).

Suggested next step: Pair this with call recordings or counsellor coaching data (if available) to identify what separates a "Connected" call that converts from one that doesn't.

---

5. Insight #3: Counsellor Performance Varies Meaningfully

The Counsellor Performance chart compares total leads handled against conversion counts across six counsellors (Darshan, Rayaan, Shantanu, Shubham, Sachin, Shikha).

Finding: While most counsellors handle a similar lead volume, conversion counts differ — some counsellors are converting leads more effectively than others relative to their volume.

Business implication: This creates an opportunity to identify what top-performing counsellors are doing differently and share those practices across the team, rather than assuming performance gaps are purely due to lead quality.

Suggested next step: Calculate a per-counsellor conversion rate (not just raw counts) to normalize for volume differences and get a fairer performance comparison.

---

6. Insight #4: Monthly Trend Shows Growth Momentum

The Monthly Trends chart tracks Total Leads and Total Revenue from October to December 2025.

Finding: Both leads and revenue show an upward trend heading into December, after a dip in November.

Business implication: This could reflect seasonal buying behavior, a successful campaign push, or improved sales execution late in the quarter — worth investigating further to replicate the cause.

Suggested next step: Overlay marketing campaign dates or promotional periods onto this trend line to identify what specifically drove the December uptick.

---

7. Summary Recommendation

Based on the combined insights, the highest-leverage actions are:

1. **Shift more marketing budget toward Ads**, the stronger-performing channel.
2. **Invest in improving connected-call conversion quality**, since this is the largest and most controllable segment of the funnel.
3. **Study and replicate top-counsellor techniques** across the team to close the performance gap.
4. **Investigate the drivers behind the December growth spike** to see if it can be sustained or replicated.

This analysis was derived entirely from the dashboard visuals and is intended to demonstrate a data-driven, business-first approach to sales reporting.
